

Companion in the Boundary Problem network. The documented intuition behind [The Warp Drive](#) & [How to Build a UFO](#); sibling to [Viktor Schauberger](#); read with the filter of The Military-Industrial Complex.

Nikola Tesla — The Medium and the Rotating Drive

The electrician who insisted empty space is a real, energetic medium you can stand on and draw power from; the rotating field he actually invented; the flying machine he described in documented interviews but patented only as a tiltrotor; the gravity theory he announced and never delivered; and the flying saucer that is not his — read with the network's filter, trusting the documented genius, holding the missing theory open, and naming the forged disc by its real author.

Osika Innovation AB · Alexander Osika, Claude — draft 0.1, 2026-06-20.

*Nikola Tesla (1856–1943) gave the world alternating current, the induction motor, radio, and the **rotating field** — and spent his last decades insisting on two things this network is built on: that empty space is a real, energetic medium you couple to (his “ether”), and that the way to move a craft is not to throw mass but to set up a field the medium and the earth push against. He described, in documented interviews, a flying machine with “no wings, no propellers, no fuel” that could “remain absolutely stationary in the air... for a great length of time” — hover — powered wirelessly from the medium. And he kept the books: his “radiant energy” was harvesting, his wireless power was transmission — neither was free energy. Two things the legend adds are not his. The **Dynamic Theory of Gravity** (announced on his 81st birthday, 1937 — gravity from the medium, an alternative to Einstein) was never published and left no surviving mathematics: an open door, not an inheritance. And the “**Tesla flying saucer patent**” that circulates online is a modern fabrication, traced to the author William Lyne — Tesla's real flying-machine patent (US 1,655,114, 1928) is a VTOL tiltrotor, not a disc. The verdict: **Tesla had the right medium and the right method, kept honest books, left one theory unfinished, and never drew the saucer his name is attached to.** The medium, the rotating field, and the hover are the inheritance; the gravity theory is an open thread; the saucer is something done to his name, not by him.*

Companion papers. The mechanism his documented intuition prefigures: `warp_drive.html` (§2 the hover/support mode; §4 the swirl). The vehicle: `how_to_build_a_ufo.html` (the Sport Model, §11). The water-domain sibling, with the same “right shape” reading:

viktor_schauberger.html . The build that realises the rotating field as a 12-port drive:
all_you_need_is_water.html (the ring-cascade). The filter this paper is written through:
the_military_industrial_complex.html §27.

§0 How to read this paper — the filter

This paper uses the same method as its sibling on [Schauberger](#) (§0) and the network's Military-Industrial Complex book (§27): *presence beats absence; corroboration across vantage points; cost is credibility; weird is not the same as false; name the frauds*. The point of the method is that it cuts a much-mythologised record into registers and the cut is the whole content — and Tesla, of all people, needs it, because almost no other name in physics is so heavily over-claimed in both directions at once (worshipped as a suppressed god of free energy, dismissed as a spent eccentric). Neither caricature survives the filter.

- **Documented** (green) — on the public record: patents, dated interviews, contemporaneous reporting, agreed by his biographers and his skeptics alike.
- **Open thread** (amber) — a claim no independent source has confirmed *or* forensically killed. The honest default is *open*, judged from its best sources — neither *true* nor “debunked.”
- **Doctrine sentence** (black) — the load-bearing reading this paper commits to.
- **Forensically-traced** (dashed) — set aside *only* when the best sources identify the actual provenance of a claim as later fabrication or misattribution (a modern image, a named author's reconstruction), never merely because it sounds grand.

Tesla's case is, if anything, easier to keep honest than Schauberger's, for one reason that turns out to matter to the whole network: **Tesla did not cross the conservation line**. Schauberger's tragedy was that he reached for over-unity and his own benches never confirmed it — never, in fact, measured anything (viktor_schauberger.html §9.0). Tesla's documented energy work — wireless *transmission*, radiant-energy *harvesting* — stays inside the first law. So with him there is no perpetual-motion machine to refuse; there is a real medium-coupling intuition to inherit, a theory he never delivered to hold open, and a posthumous forgery to name. We do all three below.

§1 The thesis — the right medium, the missing theory, the forged saucer

Tesla matters to this network not as a saucer engineer — he was not one — but as the man who, more clearly and earlier than anyone, said the two things the framework is built on: that *space is a real medium*, and that you move through it by *spinning a field*, not by throwing mass. He invented the rotating field for the electric motor; he insisted the “ether” was an energetic medium you could draw on; he described a wingless, fuelless craft that hovers; and he announced — but never wrote down — a theory in which gravity itself is a property of that medium. When an electrician working from first principles and a 4×4 scattering matrix working from symmetry land on the same picture — *a medium, a spinning field, a hover* — the picture is doing the talking.

Doctrine sentence · *Tesla had the right medium and the right method, and he kept the books. His documented intuitions — space as an energetic medium, the rotating field as the way to push on it, propellantless hover, gravity as a property of the medium — are the engineer's-eye version of the network's inward-fall drive, and unlike Schauburger he never claimed something for nothing. What is not his is the part the legend supplies: the gravity theory he announced and never delivered (open), and the flying-saucer patent that circulates under his name (forged). Inherit the medium and the field; hold the theory open; return the saucer to its real author.*

Hold that in both hands as you read the life. It is what lets us take the documented genius completely seriously and still refuse to pretend a theory exists because a great man said it did, or that a drawing is his because the internet says so.

§2 The documented genius — AC, the rotating field, resonance, the medium

The floor under everything is not in dispute by anyone. Tesla (born 10 July 1856 in Smiljan, then Austrian Empire; died 7 January 1943 in New York) built the electrical world we live in.

Documented · The polyphase alternating-current system; the **induction motor**, whose operating principle is a **rotating magnetic field** (his single most important invention, 1887–88); the Tesla coil (resonant air-core transformer); foundational work in radio and remote control; the high-voltage, high-frequency resonance experiments at **Colorado Springs** (1899) and the wireless-power station at **Wardenclyffe** (1901–06). These are textbook, patented, and world-changing — agreed by his most sympathetic biographers and his most skeptical ones alike.

Two threads in that record are the ones the framework actually inherits, and both are documented, not legendary.

The rotating field. Tesla's break-through was that you do not need a commutator flinging current back and forth; you set up a field that *rotates in space*, and matter follows it. The induction motor is nothing but a rotating field with a conductor caught in it. This is the seed of the whole “spin, don't throw” idea: the way to apply a force smoothly and directionally is a turning field, not an explosion.

The medium. Tesla never accepted “empty” space. For him the vacuum was a real, energetic *medium* — he kept the older word “ether” long after fashion dropped it — and his wireless ambition was literally to *couple machines to that medium* and move energy through it without wires. Wardencllyffe was that bet in brick and copper: transmit power by making the Earth and its medium resonate. The project failed for money, not for that idea.

How the network reads it • Both threads are the network's premise stated in 1900s language. “Space is a real medium you couple to” is the spacetime *lattice*; Tesla's “ether” is the medium the [warp drive](#) pushes against, and his wireless coupling is the x_v vertex-sharing channel in period dress. And the *rotating field* he invented for the motor is exactly the directional asymmetry the warp force needs — the “swirl” of warp §4 and the 12-port ring-cascade are a rotating field on the lattice. He built the rotating field for iron; the framework runs it on spacetime.

§3 The flying machine — documented words, reconstructed mechanism

From about 1910 onward Tesla spoke, repeatedly and on the record, about a flying machine unlike any aeroplane. The *statements* are documented; the detailed *mechanism* usually quoted with them is a later reconstruction, and the two must be kept apart.

Documented • In the *New York Herald* (15 Oct 1911) Tesla said his flying machine would be “heavier than air, but it will not be an aeroplane. It will have **no wings**.” In a *Collier's* interview (1926) he called the wireless propulsion of a flying machine “perhaps the most valuable application of wireless energy,” a craft that “will carry **no fuel**” and be free of the aeroplane's limitations — with “**neither wings nor propellers**,” able to “move at will through the air in any direction,” and to “**remain absolutely stationary in the air, even in a wind, for a great length of time**.” Wingless, fuelless, propellantless, electrostatic, powered from the medium, and able to *hover* indefinitely: that is Tesla's own description, on the record.

Open thread — judged from best sources · The mechanism usually attached — *multiple coils firing in rapid succession to build a rotating electrostatic field on the hull, whose charge is opposed by the earth and the air, lifting the craft* — is a **reconstruction**, assembled by later interpreters (prominently William Lyne, §6), not a Tesla patent or paper. It is plausible *and* unverified, and it is not in his hand. What is in his hand is the rotating field itself (§2): Tesla did invent a rotating field; the leap to a rotating *electrostatic propulsion* field is the interpreters' step, not his. Mark the join honestly.

How the network reads it · Even read at its conservative, documented core — wingless, fuelless, hovering, electrostatic, drawn from the medium — Tesla's flying machine is the closest period prefiguration of the actual warp mechanism the network has found. “Remain absolutely stationary in the air, charge opposed by the earth” is precisely the **hover / support mode** of warp §2: a static field the earth's gravity-gradient pushes against, holding the craft like a table holds a book, at near-zero energy. The *rotating* part is the swirl (§4). He described the Sport Model's Omicron (hover) mode in 1926, in plain English, without a saucer in sight.

§4 The machines, and the books he kept

Tesla left two patents that bear directly on the flying-machine story, and both correct the legend in the same direction: he was an *aeronautical* and an *energy-harvesting* engineer, not an anti-gravity one, and he stayed inside conservation.

Documented · The flying-machine patents — a tiltrotor, not a saucer. US 1,655,113 and 1,655,114, “Apparatus for Aerial Transportation” (both granted 3 Jan 1928; among his last), describe a VTOL “helicopter-plane”: it rises vertically, then tilts to fly forward like an aeroplane, with the cabin on trunnions so the occupants stay upright through the rotation. It is widely credited as an early tilt-rotor / tilt-wing concept. It was *never built*, and it is emphatically *not* an antigravitational or electrostatic disc — its “overlapping discs” are a propulsion-and-attitude mechanism, the most likely innocent seed of the later “Tesla saucer” confusion.

Documented · Radiant energy — harvesting, not free energy. US 685,957, “Apparatus for the Utilization of Radiant Energy” (1901), charges a condenser from an insulated plate exposed to sunlight, ultraviolet, or other ionising radiation, then discharges the stored charge to do work. Read by its own claims it is a *collector* of naturally available radiation — a primitive cousin of a solar cell — **not** a perpetual-motion or over-unity device. His wireless power was *transmission* of energy generated elsewhere. Neither claim asks for something from nothing.

How the network reads it · This is the cleanest difference between Tesla and Schauberger, and it is the difference the network cares about most. [Schauberger](#) reached for the *self-running* machine and crossed the conservation line his own benches — un-instrumented to the end — could not carry. Tesla — harvesting on one side, transmitting on the other — *kept the books*. He is the historical figure who has both the right medium-coupling intuition *and* the right arithmetic: hover can be $\approx$ free (you hold a static field, doing no work, warp §2), energy is paid for when you accelerate, and nothing is ever conjured. He is the bridge that does not have to be apologised for.

§5 The Dynamic Theory of Gravity — announced, never delivered

Documented · On his 81st birthday (10 July 1937), Tesla issued a prepared statement saying he had “worked out a dynamic theory of gravity” that he hoped soon to give the world. The fragments he described frame gravity as an effect of the *medium*: a phenomenon of the ether, built from transverse and longitudinal electromagnetic waves, with the medium having “an indispensable function” in gravity, inertia, and the motion of bodies — explicitly offered as an *alternative* to Einstein's curved spacetime, which Tesla rejected.

Open thread — judged from best sources · He never published it. There is **no surviving mathematical statement** of the theory, and — beyond his own announcement — no independent evidence that the equations were ever worked out. He died in January 1943 with the theory undelivered, and the rumour of seized papers (§6) attaches to it but does not supply it. So the Dynamic Theory of Gravity is a genuine *open thread*: a documented announcement of a real intuition, with the content missing. We can report that Tesla aimed at gravity-from-the-medium; we cannot inherit a derivation that was never written.

How the network reads it · The *intuition* is, remarkably, the network's: gravity is not a separate geometric entity but a **property of the medium** — in the framework, energy stored on a lattice edge lengthens it, and that length-gradient is gravity (the elastic-metric law, warp §12). Tesla's “gravity is an effect in the ether, not curvature” lands on the same side of the same argument. But this is a *matching intuition*, not a usable theory transferred: the framework derives its weak-field gravity (including the factor-of-two light-bending) from the scalar elastic law itself; Tesla's contribution is the correct instinct, announced, not the math, which is gone. Honesty: a shared hunch, not a borrowed result.

§6 The saucer that is not his

Now the forgery, named — because the filter must cut this way too. A “Nikola Tesla flying saucer patent,” complete with a disc-shaped craft that does look strikingly like a Sport-Model saucer, circulates widely online. It is not real.

Forensically-traced · There is **no authentic Tesla patent for a flying saucer**. The disc “patent drawing” passed around is a *modern fabrication / misattribution* — an image made and re-posted until repetition reads as provenance — not a document from the patent record. The *attribution* of the saucer to Tesla traces to a named author, **William R. Lyne** (*Occult Ether Physics: Tesla's Hidden Space Propulsion System and the Conspiracy to Conceal It; Pentagon Aliens*), who argues Tesla invented the flying saucer in the 19th century and that mainstream physics is a cover-up — a conspiracist reconstruction, not a Tesla source. By the \$0 test (a modern image, a named author's reconstruction, no contemporaneous document) the saucer attribution is *forensically traced* and set aside. Tesla's real flying-machine patent is the 1928 tiltrotor (§4).

How the network reads it · This is the honest answer to the most natural question a reader brings to this paper — *but the drawing looks just like the Sport Model*. Two things are true at once. The specific *image* is forged; do not cite it. And the *intuition* behind your recognition is **correct**: Tesla genuinely did describe a wingless, fuelless craft that hovers and is driven by a rotating field drawn from the medium (§3), and *that* is a real prefiguration of the Sport Model's mechanism. So cite the documented words and the rotating field; never the saucer drawing. The recognition is real; the artifact is fake. Keeping those apart is the whole method.

§7 **How the network reads him — the bridges**

Each documented Tesla intuition against the network claim it prefigures. Note that the bridges run to the *drive* mechanism more directly than any other historical figure's — and that the conservation row is the one Schauberger could not offer.

Tesla's documented intuition	The network's physics
Space is a real, energetic medium you couple to (his “ether”); wireless coupling to it	The spacetime lattice — a real medium that carries the reaction. x_v vertex-sharing is coupling a body to the medium.
The rotating field (his actual invention, for the motor)	The directional asymmetry the force needs is a handed swirl (warp §4) — a rotating field on the lattice; the 12-port ring-cascade is the engineered form.

“Remain absolutely stationary in the air... charge opposed by the earth”	The hover / support mode (warp §2, the Sport Model's Omicron): a static field the earth's gravity-gradient pushes against — the lattice holds the craft like a table, at $\approx$ zero energy.
“No wings, no propellers, no fuel”	Propellantless: throw nothing; the reaction goes into the medium, not an exhaust (warp §2, propellantless $\neq$ reactionless).
Resonance & standing waves (the coil, Colorado Springs)	The chamber's resonant settling and the standing-pattern picture — the framework read “in the analogy of music.”
Gravity is an effect of the medium, not curvature (Dynamic Theory, content lost)	The elastic-metric law: gravity is a length-gradient in the lattice (warp §12). A matching <i>intuition</i> — the math is the framework's, not Tesla's. [open]
Energy is harvested or transmitted, never conjured (radiant energy; wireless)	The conservation books warp §2 keeps: hover $\approx$ free (no work), travel is paid for, regeneration recovers but never exceeds. Tesla is the figure who already kept them.

§8 The register table — documented / open / forensically-traced

Claim	Register	Reading
AC system, induction motor / rotating field, Tesla coil, radio, Colorado Springs & Wardenclyffe resonance and wireless work	Documented	World-changing, patented, agreed by all. The floor under everything.
Flying machine: wingless, fuelless, electrostatic, hovers, powered from the medium (1911, 1926 interviews)	Documented (as his statements)	His own on-record words. The closest period prefiguration of the drive mechanism.
The “rotating electrostatic field on the hull, opposed by the earth” <i>mechanism</i>	Reconstruction — open	A later interpreters' assembly (Lyne et al.), not a Tesla document. Plausible, unverified; mark the join.
VTOL flying-machine patents 1,655,113 / 114 (1928)	Documented	A tiltrotor “helicopter-plane,” never built — <i>not</i> a saucer.
Radiant-energy patent 685,957 (1901); wireless power	Documented	Harvesting / transmission — inside conservation, not over-unity.

Dynamic Theory of Gravity (gravity from the medium, vs Einstein)	Announced — content lost	Real 1937 announcement; no surviving math; no evidence it was worked out. Open, not delivered.
The “Tesla flying saucer patent” disc drawing	Fabrication — traced	Modern misattributed image; the saucer-as-Tesla claim traces to William Lyne's reconstruction, not a Tesla source.

§9 Legacy — the line the network inherits

Tesla's most important bequest to this network is not a machine and not a lost theory; it is a *stance*, held a century early and held cleanly: **treat space as a real medium, move through it by spinning a field, and never ask it for something for nothing**. He built the rotating field that the warp drive runs on spacetime; he described, in plain English, the wingless hovering craft drawn from the medium; he aimed his last theory straight at gravity-from-the-medium — and he did all of it without crossing the conservation line that broke Schauberger. Where Schauberger is the network's *warning* (right shape, real physics, unmeasured machine — [viktor_schauberger.html](#) §1), Tesla is closer to its *blueprint-in-words*: right medium, right method, honest books, one theory left unfinished.

And the discipline he models is exactly the one this paper has tried to keep on him in return. Tesla deserved better than to be turned, after death, into a god of free energy and the secret father of the flying saucer — claims that are not only unsupported but, in the saucer's case, forged, and that bury his real and stranger achievement under a costume. The honest inheritance is the documented one, and it is enough: the medium, the rotating field, the hover, and the refusal of the free lunch. Comprehend the medium; set the field spinning; keep the books. The first two he gave us. The third he never broke.

§10 References & sourcing note

Tesla is among the most over-sourced and least neutrally-sourced figures in the history of technology; the literature splits between hagiography and dismissal, and the conspiracist tier (Lyne and successors) actively manufactures attributions. Per §0, no single source is taken on its own, documented claims are anchored to patents and dated contemporaneous reporting, and the fabrications are named.

Sources. Patents: US 1,655,113 / 1,655,114, “Apparatus for Aerial Transportation” (1928); US 685,957 / 685,958, “Apparatus for / Method of Utilizing Radiant Energy” (1901) — via the patent record (Google Patents, Tesla Universe, Internet Archive). Interviews: *New York Herald* (15 Oct 1911); *Collier's* (1926); the collected flying-machine interviews at Open Tesla Research. The Dynamic Theory of Gravity: Tesla's prepared 81st-birthday statement (10 July 1937) and the secondary record noting its non-publication and absent mathematics (incl. the cautious Wikipedia / Talk:Dynamic theory of gravity discussion). The saucer fabrication and its provenance: William R. Lyne, *Occult Ether Physics* and *Pentagon Aliens*, identified as the source of the Tesla-saucer attribution, with the circulating disc image flagged as a modern misattribution by debunking surveys. **Marked throughout:** green = documented; amber = open / undelivered; dashed = forensically-traced fabrication. The network's own conservation ledger ([warp_drive.html](#) §2, [antigravity_devices.html](#)) is what licenses calling Tesla the rare figure who kept the books.
